

Phase 1 – Brainstorming & Ideation

Problem Statement

Networking events provide opportunities but many attendees struggle to start meaningful conversations. This project develops an AI-powered Personalized Networking Assistant that generates context-aware conversation starters using DistilBERT and GPT-2, verifies facts using Wikipedia, and learns from user feedback.

Brainstorming

Ideas considered: AI Resume Builder, AI Interview Assistant, and Personalized Networking Assistant. The final idea was selected because it solves a real-world problem and combines multiple AI technologies.

Proposed Solution

The application accepts an event description, user biography, and interests. DistilBERT extracts themes, GPT-2 generates conversation starters, Wikipedia verifies facts, and feedback/history improve future recommendations.

Empathy Map

Users think: 'How do I start a conversation?' They feel nervous and lack confidence. They want meaningful networking and use AI-generated suggestions.

Ideation Canvas

People: students, professionals, entrepreneurs. Pain points: social anxiety and lack of conversation ideas. Solution: personalized AI conversation starters with fact verification. Outcome: confident and meaningful networking.

Why This Project

Demonstrates practical Generative AI, NLP integration, scalable architecture, and solves a genuine communication challenge.
