

# Phase 2 – Requirement Analysis

## Introduction

This phase identifies the functional and non-functional requirements, users, technologies, and system interactions for the Personalized Networking Assistant.

## Functional Requirements

Generate conversation starters; Analyze event themes; Verify facts using Wikipedia; Store history; Collect user feedback; Display history and feedback statistics.

## Non-Functional Requirements

Fast response time, scalability, usability, reliability, security, maintainability, and modular architecture.

## User Stories

As a user, I want AI-generated conversation starters. As a user, I want to verify facts. As an admin/developer, I want feedback analytics.

## Technology Stack

Frontend: Streamlit  
Backend: FastAPI  
AI Models: DistilBERT, GPT-2  
API: Wikipedia  
Language: Python  
Testing: Pytest

## Customer Journey

User opens app → enters event details → AI analyzes themes → generates starters → verifies facts if needed → user rates suggestions → history stored.

| Actor  | Use Cases                                                                         |
|--------|-----------------------------------------------------------------------------------|
| User   | Enter event details, generate starters, verify facts, give feedback, view history |
| System | Analyze themes, generate responses, store logs, fetch Wikipedia summaries         |
