

Phase 7 – Final Deliverables

Project Overview

The Personalized Networking Assistant is an AI-powered web application that helps users initiate meaningful conversations during networking events. It analyzes event themes using DistilBERT, generates conversation starters using GPT-2, verifies facts using the Wikipedia API, and stores user history and feedback.

Project Deliverables

- Source Code
- GitHub Repository
- Project Documentation
- README File
- Requirements File
- Performance Testing Report
- Presentation (PPT)
- Demo Video (to be recorded)
- User Manual

Project Outcomes

The project successfully demonstrates the practical application of Generative AI and NLP for personalized networking. The modular design enables future scalability and integration with advanced language models.

Future Scope

Integrate larger language models, cloud deployment, multilingual support, user authentication, recommendation engine, analytics dashboard, and database support such as MongoDB or PostgreSQL.

Conclusion

The project addresses the challenge of initiating meaningful conversations at networking events. It combines AI-powered theme extraction, conversation generation, fact verification, and feedback collection into a single, user-friendly application.
